2 Basic Usage

2.1 Very Basic

- Mono ruby (`m` option): one ruby block per one kanji.

E.g. `\ruby[m]{鷹}{たか}` → 鷹 `\ruby[m]{鶯}{うぐいす}` → うぐいす

- Group ruby (`g` option): one ruby block per kanji sequence.

E.g. `\ruby[g]{雲雀}{ひばり}` → 雲雀 `\ruby[g]{不如帰}{ほととぎす}` → 不如帰 ほととぎす

- Jukugo ruby (`j` option): one ruby block per kanji, but read as whole.

E.g. `\ruby[j]{孔雀}{く|じやく}` → 孔雀 `\ruby[j]{七面鳥}{しち|めん|ちょう}` → 七面鳥 しちめんちょう

The current implementation uses the following strategy: if none of the ruby string per a kanji causes protrusion, then the whole is typeset as mono-ruby; otherwise, the whole is typeset as group-ruby, ignoring the ruby grouping.

- A `|` symbol in a ruby string denotes the boundary of reading for each kanji (i.e. 孔 = く and 雀 = ジやく). It is not needed in group ruby.
- Comparison of typeset results:

Mono	<code>(\ruby[m]{小鳩}{こ ばと})</code>	→ 小鳩	鶴	雷	鳥	燕
Group	<code>(\ruby[g]{小鳩}{こばと})</code>	→ 小鳩	鶴	雷	鳥	燕
Jukugo	<code>(\ruby[j]{小鳩}{こ ばと})</code>	→ 小鳩	鶴	雷	鳥	燕

Usually When a jukugo has per-character reading then jukugo ruby (`j`) is preferred, otherwise (`g`) is. If you particularly intend to show the per-character reading for a jukugo, you might use the `m` option. Note that all of `m`, `g` and `j` lead to the same result for ruby to a single kanji.

- You can give a default value of option using the `\rubysize` command; `\rubysize[g]\ruby{軍鶯}{しゃも}` is equivalent to `\ruby[g]{軍鶯}{しゃも}`. The “default of default” is `|cjPeF|`.

2.2 Intrusion/Protrusion

- Control of ruby intrusion:

No intrusion	この\ruby[-]{鶴}{かささぎ}の → この 鶴 の	かささぎ	この 鶴 の	この 鶴 の
Small intrusion	この\ruby[(-)]{鶴}{かささぎ}の → この 鶴 の	かささぎ	この 鶴 の	この 鶴 の
Big intrusion	この\ruby[<->]{鶴}{かささぎ}の → この 鶴 の	かささぎ	この 鶴 の	この 鶴 の

- If you require “ruby output may intrude to kana but not to kanji,” then you might want to do “この\ruby[<-|]{鶴}{かささぎ}等” to get “この鶴 等.”
- To specify a basic mode (`m/g/j`) and intrusion at a time, you can use option strings such as `|g|` and `|m>`. In fact, the symbol `-` works as placeholder for basic mode and means the use of default value.
- Control of ruby protrusion: the string `||` suppresses the protrusion.

すずめ 雀の… ← \ruby[->]{雀}{すずめ} インコの	vs.	すずめ 雀の… ← \ruby[->]{雀}{すずめ} インコの
--	-----	---

2.3 More Commands

- `\aruby`: attaches ruby to an alphabet (non-CJK) string.

E.g. `\aruby{Get out}{ゲラウッ}!` → Get out!

- `\rubyfontsetup`: specifies the font used for ruby output. For example, when you want to attach mincho-font ruby to gothic-font kanji string you can do as follows:

`\rubyfontsetup{\mcfamily}この{\gtfamily \ruby[j]{明朝体}{みんちょうたい}} → この明朝体`
